Minor Project Mid-Sem Evaluation
Phase 2

Presented By:
Tahira Mehta
Mansirat Kaur

Under the Guidance of: Dr. Amritpal Singh
Department of Computer Science
Academic Year: 2025–26

Problem Statement

The institute currently uses a third-party software for project fund management. However, since the software is not developed in-house, it lacks customization options to suit the institute's specific requirements.

Challenges Faced:

- Difficulty in tracking head-wise expenditures as per institutional structure.
- Limited flexibility in modifying approval workflows and reporting formats.
- Dependency on external vendors for updates and maintenance.
- Delays in approvals and fund disbursal due to restricted automation and integration with internal departments like Accounts and Registrar.

Need: Development of an in-house, web-based financial project management system for automation, transparency, and real-time monitoring.

Proposed Solution

- Digitize the process of project registration and expenditure head creation.
- Establish a structured approval workflow from PI to Admin via hierarchical roles (AO1, AR, DR).
- Enable tracking of project sanctions, grant releases, and budget bookings.
- Implement role-based access control for transparency and accountability.
- Minimize manual errors and reduce delays in fund handling.

Tech Stack & System Architecture

Three-Tier Architecture

1. Presentation Layer

- React.js + Vite
- Tailwind CSS
- TypeScript

2. Application Layer (Backend)

- PHP
- Request handling
- Session management
- Workflow control

3. Database Layer

- MongoDB Database
